

FOR IMMEDIATE RELEASE

## **Resite Information Technology Releases Public Application Programming Interface (API) for Multifamily Partners**

**May 27, 2006 -- Resite Information Technology, LLC** (<http://www.resiteit.com>) today issued a production version of their public application programming interface (API) to their resident portal product, ResidentHub. The API allows multifamily real estate property managers, software vendors and other third party services providers to work directly with ResiteIT's ResidentHub<sup>SM</sup>.

With the new API, multifamily property owners can create and modify ResidentHub<sup>SM</sup> accounts and receive a formatted letter welcoming the new account holders to the premier resident services portal and highlighting the service's benefits. Additionally, payment transaction data can be retrieved via the API. This new service can eliminate the need for repetitive data entry and usage of multiple websites to access the data.

ResiteIT's staff has already created systems to integrate directly with many multifamily real estate service firms like Yardi Voyager , Realeum Foundation, and Realpage OneSite. The new API allows other organizations and property owners who have created custom lease management and accounting systems in-house to experience the same benefits. The API is well-documented and designed to be easy to use.

"The product [ResidentHub] provides all of the online services that modern renters are demanding. Yet, to some, the ResidentHub is just another system for property managers to use. With our new API, we hope to alter that sentiment," says Marc Guyer, Lead Engineer at ResiteIT. "Now owners can provide the online services that residents demand while saving even more time in the office."

The ResidentHub provides residents with access to electronic rent payments, service requests, moving assistance and other communication and transaction tools.

For access to the Resite API, contact Mike Trotzke at (812) 245-1019, or email [mike@resiteit.com](mailto:mike@resiteit.com).
